[Mutable multidimensional array as a function argument](#)

[Ask Question](#)

In rustc 1.0.0, I'd like to write a function that mutates a two dimensional array supplied by the caller. I was hoping this would work:

```
fn foo(x: &mut [[u8]]) {  
    x[0][0] = 42;  
}  
  
fn main() {  
    let mut x: [[u8; 3]; 3] = [[0; 3]; 3];  
    foo(&mut x);  
}
```

It fails to compile:

```
$ rustc fail2d.rs  
fail2d.rs:7:9: 7:15 error: mismatched types:  
expected `&mut [[u8]]`,  
  found `&mut [[u8; 3]; 3]`  
(expected slice,  
  found array of 3 elements) [E0308]  
fail2d.rs:7      foo(&mut x);  
                  ^~~~~~  
error: aborting due to previous error
```

I believe this is telling me I need to somehow feed the function a slice of slices, but I don't know how to construct this.

It "works" if I hard-code the nested array's length in the function signature. This isn't acceptable because I want the function to operate on multidimensional arrays of arbitrary dimension:

```
fn foo(x: &mut [[u8; 3]]) { // FIXME: don't want to hard code length of nested array  
    x[0][0] = 42;  
}  
  
fn main() {  
    let mut x: [[u8; 3]; 3] = [[0; 3]; 3];  
    foo(&mut x);  
}
```

tldr; any zero-cost ways of passing a reference to a multidimensional array such that the function use statements like \$x[1][2] = 3;\$?

This comes down to a matter of memory layout. Assuming a type `T` with a size known at compile time (this constraint can be written `T: Sized`), the size of `[T; n]` is known at compile time (it takes `n` times as much memory as `T` does); but `[T]` is an unsized type; its length is not known at compile time. Therefore it can

only be used through some form of indirection, such as a reference (`&[T]`) or a box (`Box<[T]>`), though this is of limited practical value, with `Vec<T>` which allows you to add and remove items without needing to reallocate every single time by using overallocation).

A slice of an unsized type doesn't make sense; it's *permitted* for reasons that are not clear to me, but you can never actually have an instance of it. (`Vec<T>`, by comparison, requires `T: Sized`.)

`&[T; n]` can coerce to `&[T]`, and `&mut [T; n]` to `&mut [T]`, but this only applies at the outermost level; the contents of slice is fixed (you'd need to create a new array or vector to achieve such a transformation, because the memory layout of each item is different). The effect of this is that arrays work for single-dimensional work, but for multi-dimensional work they fall apart. Arrays are currently very much second-class citizens in Rust, and will be until the language supports making slices generic over length, which it is likely to eventually.

I recommend that you use either a single-dimensional array (suitable for square matrices, indexed by `x * width + y` or similar), or vectors (`Vec<Vec<T>>`). There may also be libraries already out there abstracting over a suitable solution.
