How do you push values to a vec inside an enum struct in Rust?

I'm trying to figure out how to push values to a vec inside an enum that's defined as a struct.

Here's the setup along with some of the stuff I tried:

```
enum Widget {
    Alfa { strings: Vec<String> },
}

fn main() {
    let wa = Widget::Alfa { strings: vec![] };

    // wa.strings.push("a".to_string());
    // no field `strings` on type `Widget`

    // wa.Alfa.strings.push("a".to_string());
    // no field `Alfa` on type `Widget`

    // wa.alfa.strings.push("a".to_string());
    // no field `alfa` on type `Widget`

    // wa.Widget::Alfa.strings.push("a".to_string());
    // expected one of `(`, `.` , `;` , `?` , `}` , or an operator, found `::` 

    // wa["strings"].push("a".to_string());
    // cannot index into a value of type `Widget`
}
```

Is it possible to update a vec in an enum after it's been created? If so how does one go about that?

(NOTE: It was suggested that this is a duplicate of [How do you access enum values in Rust?](#). I looked at that but it didn't address my question. It addresses how to access values, not how to update them. The two things are related, but the solution in the other answer for accessing does not accommodate updating.)

You'll need to use `match` (or `if let`) so the compiler knows which variant is considered.

You can't access the fields on an enum variant directly, because the compiler only knows that the value is of the enum type (`Widget`), not which variant of the enum it has. You have to destructure the enum, for example with a `match`:

```
let mut wa = Widget::Alfa { strings: vec![] };
```

```

match &mut wa {
    Widget::Alfa { strings /*: &mut Vec<String> */ } => {
        strings.push("a".to_string());
    }

    // if the enum has more variants, you must have branches for these as well.
    // if you only care about `Widget::Alfa`, a wildcard branch like this is often a
    // good choice.
    _ => unreachable!(), // panics if ever reached, which we know in this case it won't
          // because we just assigned `wa` before the `match`.
}

```

Alternatively you can use `if let` instead:

```

let mut wa = Widget::Alfa { strings: vec![] };

if let Widget::Alfa { strings } = &mut wa {
    strings.push("a".to_string());
} else {
    // some other variant than `Widget::Alfa`, equivalent to the wildcard branch
    // of the `match`. you can omit this, which would just do nothing
    // if it doesn't match.
    unreachable!()
}

```

You can do something like this if you have one matching arm (which has no sense):

```

#[derive(Debug)]
enum Widget {
    Alfa { strings: Vec<String> },
}

fn main() {
    let mut wa = Widget::Alfa { strings: vec![] };

    let Widget::Alfa { strings } = &mut wa;

    strings.push("X".to_string());
    strings.push("Y".to_string());

    println!("{:?}", wa);
}

```

Or by using `match (if let)`:

```

#[derive(Debug)]
enum Widget {
    Alfa { strings: Vec<String> },
    Beta { string: String }
}

fn main() {
    let mut wa = Widget::Alfa { strings: vec![] };

    if let Widget::Alfa { strings } = &mut wa {

```

```
        strings.push("X".to_string());
        strings.push("Y".to_string());
    }

    println!("{{:{}}} ", wa);
}
```
